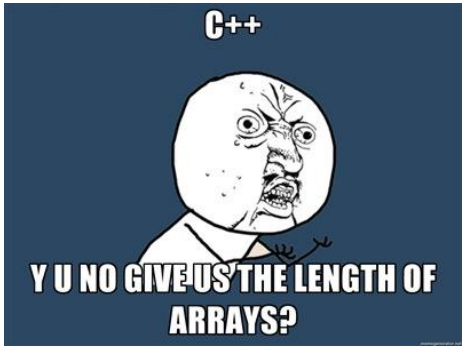
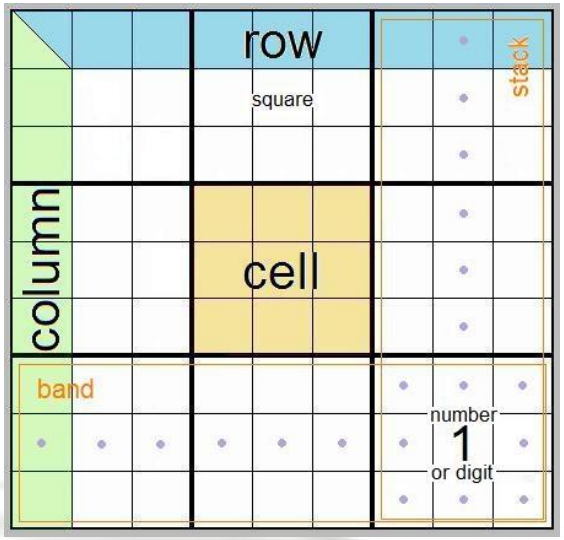
Lecture 4 - Array and Vector

Meng-Hsun Tsai
CSIE, NCKU



Sudoku Validator

- A Sudoku validator reads a Sudoku answer from a file, and then checks if the answer is valid or not.
- A Sudoku answer is a 9×9 grid filled with digits so that **each column**, **each row**, and **each of the nine 3×3 sub-grids (called cells)** that compose the grid contains all of the digits from 1 to 9.



8	4	3	5	6	7	2	9	1
5	6	7	1	9	2	4	8	3
2	9	1	4	8	3	7	6	5
1	3	2	9	7	8	6	5	4
9	7	6	3	4	5	8	1	2
4	5	8	6	2	1	3	7	9
7	8	5	2	3	9	1	4	6
3	1	4	7	5	6	9	2	8
6	2	9	8	1	4	5	3	7

Sudoku.h

```
 1  #include <iostream>
 2  class Sudoku {
 3  public:
 4      Sudoku();
 5      Sudoku(const int init_map[]);
 6      void setMap(const int  set_map[]);
 7      int getElement(int index);
 8      bool isCorrect();
 9      static const int sudokuSize = 81;
10
11  private:
12      bool checkUnity(int arr[]);
13      int map[sudokuSize];
14  };
```

Sudoku.cpp

```
 1  #include "Sudoku.h"
 2  using namespace std;
 3
 4  Sudoku::Sudoku()

70     }
71     return true;
72 }
```

public static const Data Member

- Note that the size of the array is specified as a *public static const* data member.
  - *public* so that it's accessible to the clients of the class.
  - *const* so that this data member is constant.
  - *static* so that the data member is shared by all objects of the class
- *static* data members are also known as class variables.
- When objects of a class containing *static* data members are created, all the objects share one copy of the class's *static* data members.

Error: Initialization of *const* Data Member

```
> cat -n const1.cpp
     1  class Cls {
     2  public:
     3          Cls(){ x = 3;}
     4          const int x;
     5  };
     6  int main() { return 0; }
> g++ -o const1 const1.cpp
const1.cpp: In constructor `Cls::Cls()':

static Data Member (cont.)

- A *static* data member can be accessed within the class definition and the member-function definitions like any other data member.
- A *public static* data member can also be accessed outside of the class, even when no objects of the class exist, using the class name followed by the binary scope resolution operator (::) and the name of the data member.

Sample Input and Sample Output

Number of cases

Map of case #1

Map of case #2

```
> cat su_infile
2
1 2 3 4 5 6 7 8 9

32      }
33      return 0;
34  }
```

Replacing Array with *vector*

```
 1  #include <vector>
 2  #include <cstdlib>
 3  #include <iostream>
 4  #include <fstream>
 5  #include "Sudoku.h"
 6  using namespace std;
 7  int main()
 8  {
 9      int sudoku_in[Sudoku::sudokuSize];
10      Sudoku su_tmp;
11      vector<Sudoku> su;
12      ifstream in("su_infile",ios::in);
13     int num_element, num_case;
14     in >> num_case;
    // num_case is not used in this program
15      cout << "size = " <<
                    su.size() << endl;
16      num_element = 0;
17      while(in >> sudoku_in[num_element++])
18      {                    // read in map
19          if(num_element >=
                    Sudoku::sudokuSize) {
20              su_tmp.setMap(sudoku_in);
21              num_element = 0;
22              su.push_back(su_tmp);
23          }
24      }
25      cout << "size = " << su.size() << endl;
26      cout << su[0].isCorrect() << endl;
27      for(int i = 1; i<su.size(); ++i)
28          cout << su.at(i).isCorrect() << endl;
29
30      return 0;
31  }
```

```
> ./sudoku_validate2
size = 0
size = 2
0
1
```

C++ Standard Library
Class Template *vector*

- C-style pointer-based arrays have great potential for errors and are not flexible
  - A program can easily "walk off" either end of an array, because C++ does not check whether subscripts fall outside the range of an array.

```
arr[-1]
```

  - Two arrays cannot be meaningfully compared with equality operators or relational operators.

```
if(arr1 == arr2)
```

  - When an array is passed to a general-purpose function designed to handle arrays of any size, the size of the array must be passed as an additional argument.

```
func(arr, size)
```

  - One array cannot be assigned to another with the assignment operator(s).

```
arr1 = arr2
```

C++ Standard Library
Class Template *vector* (cont.)

- C++ Standard Library class template *vector* represents a more robust type of array featuring many additional capabilities.
- Standard class template *vector* is defined in header <*vector*> and belongs to namespace *std*.
- By default, all the elements of a *vector* object are set to *0*.
- *vector*s can be defined to store any data type.

```
vector<int> v1;
vector<Sudoku> v2;
```

- *vector* member function *size* obtain the number of elements in the *vector*.

```
cout << v.size();
```

- *vector* objects can be compared with one another using the equality operators.

```
if(v1 == v2)
```

C++ Standard Library
Class Template *vector* (cont.)

- You can create a new *vector* object that is initialized with the contents of an existing *vector* by using its copy constructor.

```
vector<Sudoku> v2(v1);
```

- You can use the assignment (=) operator with *vector* objects.

```
v1 = v2;
```

- You can use square brackets, *[]*, to access the elements in a *vector*. As with C-style pointer-based arrays, C++ does not perform any bounds checking when *vector* elements are accessed with square brackets.

```
v[1];
```

- Standard class template *vector* provides bounds checking in its member function *at*, which "throws an exception" if its argument is an invalid subscript.

```
v.at(1);
```

Sorting a Vector with Insertion Sort

```
 1  #include <vector>
 2  #include <iomanip>
 3  #include <iostream>
 4  using namespace std;
 5
 6  int main()
 7  {
 8      const int size = 8;
 9      int init_array[size] =
                {64, 24, 13, 9, 7, 23, 34, 47};
10      vector<int> v(size);
11      int insert, moveItem;
12
13      cout << "Unsorted array:\n";
14      for(int i=0; i<size; ++i)
15      {
16          v.at(i) = init_array[i];
17          cout << setw(4) << v.at(i);
18      }
19      cout << endl;
20
21      cout << "Step-by-step:\n";
22      for(int next=1;next<size;++next)
23      {
24          insert = v.at(next);
25          moveItem = next;
26          while((moveItem>0) &&
                    (v.at(moveItem-1) > insert))
27          {
28              v.at(moveItem) = v.at(moveItem-1);
29              --moveItem;
30          }
31          v.at(moveItem) = insert;
32          for(int i=0; i<size; ++i)
33              cout << setw(4) << v.at(i);
34          cout << endl;
35      }
36
37      return 0;
38  }
```

Sorting a Vector with Insertion Sort (cont.)

```
22    for(int next=1;next<size;++next)
23    {
24        insert = v.at(next);
25        moveItem = next;
26        while((moveItem>0) &&
                  (v.at(moveItem-1) > insert))
27        {
28            v.at(moveItem) = v.at(moveItem-1);
29            --moveItem;
30        }
31        v.at(moveItem) = insert;
      …
35    }
```

```
Output:
Unsorted array:
 64  24  13   9   7  23  34  47
Step-by-step:
 24  64  13   9   7  23  34  47
 13  24  64   9   7  23  34  47

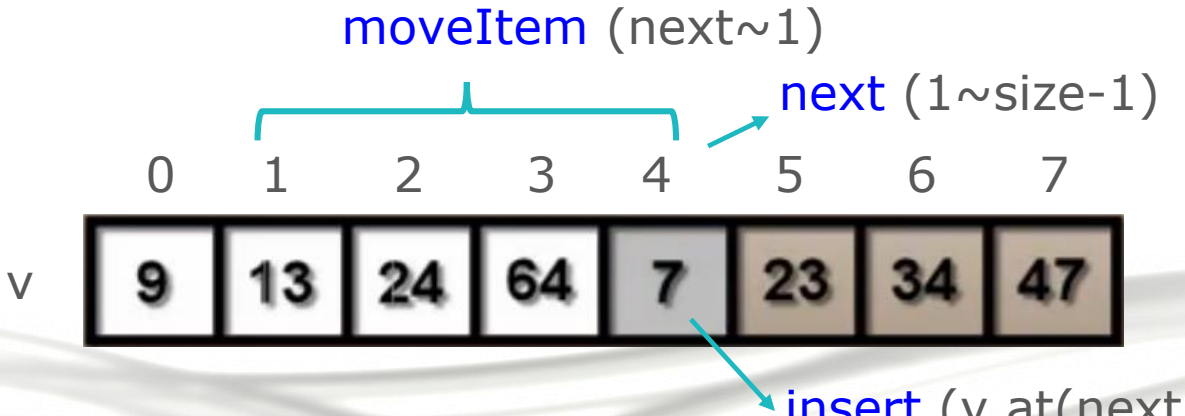
  7   9  13  24  64  23  34  47
  7   9  13  23  24  64  34  47
  7   9  13  23  24  34  64  47
  7   9  13  23  24  34  47  64
```



Using *sort()* in C++ Standard Library

```
 1 #include <vector>
 2 #include <algorithm>
 3 #include <iostream>
 4 #include <cstdlib>
 5 #include "Clock.h"
 6 using namespace std;
 7 void insertion_sort(vector<int> & v)
 8 {
 9     int insert, moveItem;
10     for(int next=1;next<v.size();++next)
11     {
12         insert = v.at(next);
13         moveItem = next;
14         while((moveItem>0) &&
               (v.at(moveItem-1) > insert))
15         {
16             v.at(moveItem) = v.at(moveItem-1);
17             --moveItem;
18         }
19         v.at(moveItem) = insert;
20     }
21 }
```

```
23 int main()
24 {
25     Clock clk;
26     const int size = 100000;
27     vector<int> v1(size),v2;
28     srandom(time(NULL));
29     for(int i=0; i<size; ++i)
30         v1.at(i) = random();
31     v2 = v1;    clk.start();
32     sort(v1.begin(), v1.end());
33     cout << "sort(): " <<
         clk.getElapsedTime() << " seconds\n";
34     cout << "v1/v2 are "<<
         ((v1==v2)?"the same.\n":"different.\n");
35     clk.start();
36     insertion_sort(v2);
37     cout << "insertion_sort(): " <<
         clk.getElapsedTime() << " seconds\n";
38     cout << "v1/v2 are "<<
         ((v1==v2)?"the same.\n":"different.\n");
39     return 0;
40 }
```

```
sort(): 0.0547 seconds
v1 and v2 are different.
insertion_sort(): 154.26 seconds
v1 and v2 are the same.
```

Clock.h and Clock.cpp

Clock.h

```
 1  #include <ctime>
 2  using namespace std;
 3  class Clock {
 4      public:
 5          Clock();
 6          Clock(clock_t s);
 7          void start();
 8          void setStart(clock_t start_ts);
 9          clock_t getStart();
